# Introduction

- The pharmaceutical industry faces vaccine supply chain concerns.
- Challenges involve transparency issues and fraud in vaccine records.
- To address these issues, develop a decentralized vaccine supply chain data management system using blockchain.
- Blockchain's decentralized, immutable nature enhances transparency, security and traceability.

# Current State of Art

- Centralized and Unclear
- Manual Tracking
- Vulnerable to Tampering
- Counterfeit Risks

# Motivation

- Enhanced Transparency
- Improved Traceability
- Data Integrity Assurance
- Decentralized Trust
- Security Against Counterfeiting

# Objectives

- To implement a decentralized system with ensured integrity, optimized traceability, and counterfeiting mitigation using blockchain technology.

# Literature Review

**Table 1: Literature Review**

SI No.	Title	Author	Objective	Features
1	Protecting Vaccine Safety: An Improved, Blockchain-Based, Storage-Efficient Scheme (2022) [2]	L. Cui et al	<ul style="list-style-type: none"> <li>● Tackle vaccine circulation reliability challenges</li> <li>● Introduce a secure blockchain for enhanced vaccine safety and traceability in circulation.</li> </ul>	<ul style="list-style-type: none"> <li>● Uses cloud for efficient off-chain storage</li> <li>● Utilizes consortium blockchain for secure recording of vaccine circulation data.</li> </ul>
2	Towards a Blockchain Assisted Patient Owned System for Electronic Health Records (2021) [3]	T. Fatokun et al	<ul style="list-style-type: none"> <li>● Introduce a patient-centric EHR system using blockchain.</li> <li>● Enhance EHR system interoperability for secure data exchange.</li> </ul>	<ul style="list-style-type: none"> <li>● Secure, consistent health records controlled by patients.</li> <li>● Patient-Centric EHR Web Portal</li> </ul>

# Literature Review Continued

**Table 2:** Literature Review

SI No.	Title	Author	Objective	Features
3	A Novel Medical Blockchain Model for Drug Supply Chain Integrity Management in a Smart Hospital (2019) [4]	F. Jamil et al	<ul style="list-style-type: none"> <li>● Creating a secure drug supply chain with Hyperledger Fabric blockchain.</li> <li>● Handling counterfeit drugs in developing country pharmaceuticals.</li> </ul>	<ul style="list-style-type: none"> <li>● Secure Drug Supply Chain Record System</li> <li>● Access Control and Permissions</li> </ul>
4	FAIR: A Blockchain-based Vaccine Distribution Scheme for Pandemics (2021) [5]	A. R. Nair et al	<ul style="list-style-type: none"> <li>● Address healthcare supply chain challenges</li> <li>● Ensure Secure and Fair Distribution System</li> </ul>	<ul style="list-style-type: none"> <li>● Focus on trust and forecasting</li> <li>● Distinct working layers</li> </ul>

# Proposed Methodology

## ● API Design

- Registering new vaccines
- Tracking vaccine batches
- Verifying vaccine authenticity
- Retrieving vaccine information

## ● Data Models

- Define data structures for vaccine batches, including attributes like batch number, manufacturer, production date, etc.
- Define structures for transactions and blocks in the Hyperledger blockchain.

## ● Middleware Development

- Implement a middleware layer in Golang to expose API endpoints.
- Utilize libraries like Gorilla Mux for routing and handling HTTP requests.

# Proposed Methodology

- **Hyperledger Integration**

- Integrate Golang middleware with Hyperledger Fabric.
- Implement smart contracts for managing vaccine transactions and authenticity verification.

- **Authentication and Authorization**

- Implement authentication mechanisms (e.g., JWT tokens) to secure API endpoints.
- Define roles and permissions for accessing different functionalities.

- **Testing**

- Develop unit tests for API endpoints and middleware functions.
- Conduct integration tests to ensure interoperability with Hyperledger.

# Proposed System - Work Flow

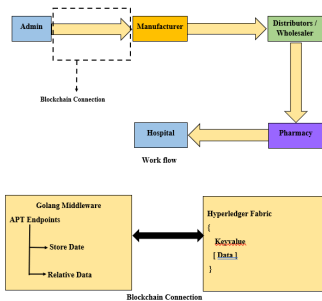

Figure 1: Work Flow

# Proposed System - Working Framework

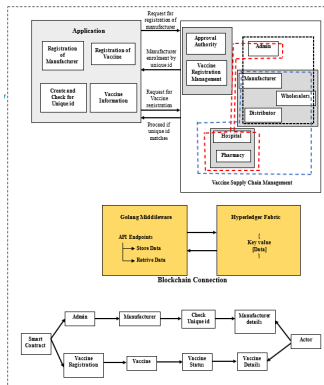

Figure 2: System Architecture

# Proposed System - Algorithm

## Algorithm: PBFT (Practical Byzantine Fault Tolerance)

- Replicas maintain state machines and logs.
- Client sends request to network.
- Primary replica assigns sequence number and sends pre-prepare.
- Replicas broadcast prepare messages and wait for  $2f+1$  prepares, where "f" represents the maximum number of faulty nodes.
- Replicas execute operation upon receiving commit messages.
- Checkpointing and view change handle faults; tolerates up to  $f$  Byzantine faults with low latency and high throughput.

# Proposed System - Database Schema

## Important Tables

Table 3: User Login Table

Field Name	Datatype	Constraints
log_id	AutoField	PRIMARY KEY
username	CharField	
password	CharField	
role	CharField	

Table 4: Manufacturer Table

Field Name	Datatype	Constraints
manufacturer_id	AutoField	PRIMARY KEY
company_name	CharField	
address	CharField	
licence_no	CharField	
status	CharField	

# Materials and Methods - Environmental Setup

## ■ Docker

- Docker containerizes applications and dependencies, ensuring consistent environments.
- It facilitates both development and deployment processes.

## ■ Hyperledger Fabric

- Establish a permissioned blockchain network.
- This network offers customizable access controls for stakeholders.

## ■ IDE

- Use Visual Studio Code for efficient code writing and debugging.

## ■ SDK

- Utilize Hyperledger Fabric SDKs for blockchain network interaction.

# Materials and Methods - Tools

- CPU: Intel Core i5 or higher
- RAM: 8 GB or higher
- Hard disk: 512 GB or higher
- Blockchain Development Framework: Hyperledger Fabric
- Smart Contract Development: Golang (Go)
- Database: MySQL
- IDE: Visual Studio Code
- Containerization Platform: Docker

# Result

- In comparison to the existing system, the proposed system achieves the following goals:
  - Immutability ensured through the utilization of the SHA3-256 hashing algorithm.
  - Data Integrity maintained via the PBFT consensus algorithm.
  - Transparency facilitated by a shared ledger.
  - Traceability enhanced by unique identifiers.
  - Security is reinforced through cryptographic features, such as public key encryption.

# Performance Analysis

**Table 5:** Performance Analysis

<b>Feature</b>	<b>Mechanism</b>	<b>Benefits Achieved</b>
Immutability	SHA-256 Hashing Algorithm	Data Remains Unalterable
Data Integrity	PBFT Consensus Algorithm	Ensures Data Consistency
Transparency	Shared Ledger	Enables Real-time Visibility
Traceability	Unique Identifiers	Facilitates Precise Tracking
Security	Cryptographic Features	Prevents Unauthorized Access
Decentralization	Distributed Ledger	Enhances System Resilience
Efficiency	Smart Contracts	Automates Processes & Reduces Errors

# Performance Analysis

- The performance of the Hyperledger Fabric platform is evaluated in terms of throughput, latency, and scalability.
- The evaluation utilizes the Hyperledger Caliper tool, which represents multiple clients capable of injecting workloads into the blockchain network.
- It depends on hardware configuration, blockchain network design, and smart contract complexity/operations.

# Conclusion & Future Scope

- Targeting a revolution in vaccine distribution within the pharmaceutical industry through blockchain technology.
- Promises to enhance trust, security, and efficiency in vaccine distribution.
- Future scope involves real-world deployment, integration with cold chain processes, and enhancement based on user feedback.

# Implementation Status and Plan

**Table 6:** Implementation Status and Plan

<b>Task</b>	<b>Status</b>	<b>Remarks</b>
Research and Analysis	Completed	
Database Design	Completed	
API Design	Completed	
Smart Contract Implementation	Completed	
Middleware Implementation	Completed	
Hyperledger Implementation	Completed	
Integration of Frontend with APIs	Completed
